

(Hard Drive Disk) (Random access)

→ : A small but most essential part of computer through which we can store a large amount of data in our computer.

→ also called electromechanical Data Storage device.

→ It is a magnetic Disk.

→ Works on principle of magnetism.

It's different types parts starts working as a magnet that's why the data is stored in magnetic form.

Essential Parts are North Pole and South pole.

The whole aluminium disk is magnetized. Then it's some parts work as North Pole and some work as South pole.

Important

→ These North and South poles represent's ((Bits)) shows electrical charge. If electrical charge is passing is called 1 and if electrical charge is not passing is called 0.

→ Non Volatile / Permanent.

→ To read and write data.

→ main disk is called Platter.

→ It's centre part is called Spindle

→ There is a device or an arm on platter called Actuator Arm it strike with Actuator and magnetize it. There is also an

Actuator axis and it has a coil where from electric current pass and magnetic field is created. This whole process is called Magnetism (Main disk magnetized)

Now Data is stored in H.D.I)

Power Connector: Power supply it gets electricity.

IDE Connector: Connected with mother board

Jumper Block: Another wire connected with mother board.

Structure:

Track

Sector

Sector of track

Cluster.

Every kind of Data will converted into 01101 form and then will store in Hard drive permanently.
