

∴ Magnetic Tape: (sequential access)

Magnetic tape is a type of data storage medium that uses magnetic properties to store digital data. It's a sequential access storage device, meaning that data is stored and retrieved in a linear sequence.

How Magnetic Tape works?

Magnetic Tape works by coating a thin, flexible plastic tape with a layer of magnetizable material, such as iron oxide or chromium dioxide. The tape is then wound onto a reel or spool.

When data is written to the tape, a magnetic head creates a magnetic field that magnetizes the tape's coating in a pattern that represents the digital data.

The tape can then be read by passing it over a read head, which detects the changes in the magnetic field and reconstructs the original data.

Characteristics of Magnetic Tape:

→ High Storage Capacity: 100 GB - 12 TB

magnetic tape can store large amount of data, making it useful for archiving and backup purpose
